The 2012 CUNY Student Experience Survey Sampling, Administration, and Analysis

For the 2012 CUNY Student Experience Survey, the Office of Institutional Research and Assessment surveyed 17,000 undergraduates attending one of the University's 17 senior or community colleges in Spring 2012. A random sample of 1,000 students was drawn from among the full- and part-time degree-seeking undergraduate students enrolled at each college.

A copy of the survey questionnaire was mailed to each of the 17,000 students on April 6, 2012. An email was sent to the students on the same day to invite them to fill out a web-based form of the questionnaire. A week later, a reminder postcard was mailed. Those not responding to the survey within two weeks of the initial mailing were mailed another copy of the survey. Three email reminders were sent in April and May. In all, 4,228 students returned a survey – a response rate of 24.9%.

Respondents in our sample were more likely to be female, to be 25 years of age and older, and to have higher GPAs than CUNY undergraduate students in general. To make the results representative of the general CUNY undergraduate population at each college and university-wide, responses were weighted in two ways: 1) to compensate for non-response bias – the under-representation or over-representation of discrete groups in the pool of respondents; and 2) to compensate for differences in the relative size of each college (disproportionate stratification).

Weighting to compensate for non-response bias: A logistic regression model was used to predict the probability of responding to the survey for each student in the sample. College of attendance, admission type, class standing, degree level, full-time/part-time status, gender, race/ethnicity, age, language spoken in the home, and cumulative GPA were significant predictors. The predicted probability of responding to the survey was computed for each student in the sample based on the logistic model. To compensate for the over-representation of those who are more likely to respond, and the under-representation of those who are less likely to respond, each respondent was weighted by the inverse of his/her predicted probability of response.

Weighting to compensate for disproportionate stratification: The same number of students (1,000) was sampled from each college, but the number of degree undergraduates differs among the colleges. Each college's degree undergraduate population represents a unique proportion of the overall degree undergraduate population at CUNY. Responses are weighted to insure that colleges are represented in sector (senior, comprehensive and community) and university averages in proportion to their contribution to the total degree undergraduate enrollment at CUNY. The same weight is applied to all respondents from a given college. Without this weighting, students from large colleges would be under-represented while students from small colleges would be over-represented in the sector and university averages.
